

Security & Privacy at a Glance

How we protect customer data, isolate tenants, and stay compliant — in plain English.

Tenant isolation (Row-Level Security)

Every customer's data lives in a locked room enforced by the database itself. We use Postgres Row-Level Security (RLS) so a query can only ever return rows belonging to the authenticated user — even a bug or attacker requesting another tenant's data is blocked at the database layer, not just in application code.

Data privacy

We do not sell customer data. We do not share data across tenants. We do not train AI models on customer content. Emails, calendar events, and contacts are read on-demand to power the agent's actions, not warehoused for marketing or analytics.

Google Workspace permissions

Read-only and narrowly scoped. We request the minimum scopes needed (Gmail read, Calendar read/create, Contacts read) and never request delete or admin-level access. Customers can revoke access from their Google account at any time.

Token & credential handling

OAuth tokens are encrypted at rest, accessed only through secure server-side views, and never exposed to the browser. Refresh tokens rotate automatically; revoked tokens are purged immediately.

Transport & infrastructure

All traffic uses HTTPS/TLS 1.2+. Backend runs on a managed serverless platform with isolated edge functions, audit logs, and automated backups. Secrets live in a managed vault, not in source code.

Human-in-the-loop by design

Normy drafts; humans approve. Outbound emails, calendar invites, and nudges are queued in an Approval Inbox for manual review before anything is sent. This eliminates an entire class of autonomous-agent risk.

Compliance posture

Built on infrastructure that supports GDPR data subject requests, SOC 2 Type II controls (via our cloud provider), and per-customer data export and deletion. Privacy policy and terms at normyagent.com/privacy and [/terms](https://normyagent.com/terms).

Incident response

Suspicious activity triggers token revocation and customer notification. We commit to disclosing material security incidents to affected customers within 72 hours of confirmation.

Data residency	US-based managed cloud	Encryption	TLS 1.2+ / AES-256
Tenant isolation	Postgres RLS per row	AI training	Never on customer data
Google scopes	Read-only; minimum required	Autonomous sending	None — all drafts
